

PassageManager

PassageManager is an automated, configurable solution that allows users to plan voyages quickly, safely and efficiently.

PassageManager utilises port, route, tidal and weather data to create a comprehensive and fully customised digital passage plan within minutes. To ensure route accuracy users enter detailed information about their vessel, including its equipment, characteristics, ship parameters, UKC limits, weather thresholds and more.

PassageManager uses this information to create fully compliant, dynamic passage plans within one solution.

Flexible and up to date, PassageManager adjusts to real-time conditions, including environment and weather, to provide improved insight on the most efficient route.

The challenges

Planning a route is a complex and time-consuming task for crew, requiring a considerable number of resources and several factors to consider.

Planning passages manually and calculating all the requirements - such as navigational waypoints, UKC, Squat, NavArea warnings, weather and outfit management - is complex. Small changes to a passage plan can take a vast amount of time to input, calculate and approve. The multiple aspects to consider can lead to errors and omissions in information.

What it enables?

Reduced risk of breaching safety and environmental regulations

Passage planning that is accurate, configurable to the vessel and responsive to changes in circumstances and environment.

Crew time

Free up time spent on creating, updating and adjusting passage plans and streamline processes that enable business agility

Guaranteed IMO compliance

Create IMO compliant, customised passage plans in minutes.

Improved insight and safety

PassageManager makes it easier and quicker for crews to collate all required elements for effective voyage planning. Users aboard can see thresholds set in accordance with company policies, such as UKC levels or weather limits, through visual alerts that flag when violations or near violations occur.

Flexible and up to date, PassageManager self-updates with the latest environmental, weather and navigational data, providing improved insight.

How it works?

Easy to use

Simple interface and touchscreen-friendly operation.

Generate routes

Generate a route between specific locations - ports or anchorages.

Compare routes

Review routes side-by-side to make the best possible decision on which optimised route to take.

Fully integrated

Integrates with ADPs, ENCs and ECDIS.

UKC and CATZOC

Access an automatic UKC calculation derived from charted depth, height of tide, draft and CATZOC.
